Advanced Modeling Techniques

Topics Covered:

- Design Intent Explained
- Importing from sketch and Pictures
- Surface Connection C1 verses C2
- Tolerance Problems and resolving Ambiguity
- When to use Fill over Loft or Sweep
- How to use 2D and 3D sketch Splines
- How to control Sketch Splines
- Explanation of C1 verses C2 continuity
- Controlling Fill, Loft and Sweep features with Reference surfaces.
- Using Surfaces Utilities: Trim, Extend, Untrim, Knit, Thicken, etc.
- Tips for Debugging Shelling
- Using Delete face and Replace Face
- How to “Part out” housings using Base Derive, Split and Split multi-body

Design Intent

© 2003 SolidWorks

SolidWorks
World

Solids Modeling verses Surface Modeling Approach

- **Solid Approach: Resultant edge is not accurate to the Design Intent**

- **Surface Approach: Resultant edge IS accurate to the Design Intent**

Resultant edge

Solids vs. Surfacing

**Solid Modeling
Approach**

**Surface Modeling
Approach**

Main Form vs. Localized features

Main Form

Local Feature

Robustness, Shelling etc.

Chances are this will NOT Shell

Chances are this WILL

Importance of Surfacing

Features not possible using more familiar
features: **rude, cut, round etc.**

N-Sided patch (Fill surface)

True Hybrid Surface/Solid Modeling

Ability to go from Solid bodies to Surface bodies back to Solid bodies in same part file.

NEW FOR 2003

Surface Modeling Features

SPLIT LINE/DELETE FACE

TRIM SURFACE

FILL SURFACE

LOFT SURFACE

SWEEP SURFACE

Importing Design Intent

Curves – Importing Design Intent

- 2D reference Profiles of Front, Side
- Brought into part via import geometry and placed on sketch plane

Example

Curves – Picture in Sketch

- Bitmap image on sketch plane
- When no hard geometry exists

Example

00148001 0001

SolidWorks
World

TIPS For Importing Design Intent

- 1) Use DXF import to a drawing or IGES import to a sketch.
- 2) Setup up reference sketches of this imported geometry at the beginning of your part that represent the Front, Top, Side of the Design.
- 3) Use the Modify Sketch tool  to position the import sketches.
- 4) Use Tools/Sketch Tools/Insert Picture when no “hard” geometry exists.

C0, C1, C2 Tangency

Also C3, C4 types in some Class A surface modelers

C⁻¹ Un-matched

C⁰ matched

C¹ Tangent Join

C² Curvature Join

C1 Tangency

C2 Continuity

No "Radii" used; all C2
connection of surfaces

00148001 0001

SolidWorks

Surface Connection

C0 CONDITION

C1 CONDITION
(Tangency)

C2 CONDITION
(Continuity)

Curve and Surface Analysis

Open GL Shading

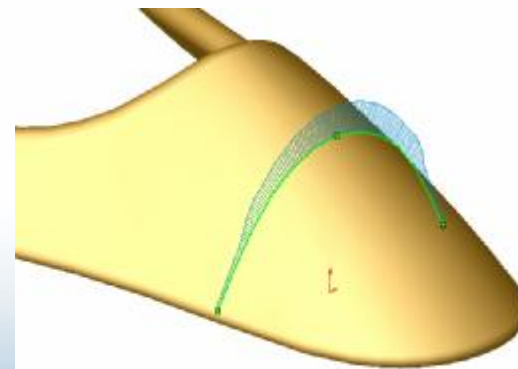

PhotoWorks Shading

Face Curvature

Face Zebra Stripes

Inspect Curvature
(intersection curve)

Resolving Ambiguity

SolidWorks switches side of cut along existing split line edge and alternates the side of cut to remove material as it traverses the sweep path.

Resolving Ambiguity - Workaround

Use Projected Curve
instead of Split line

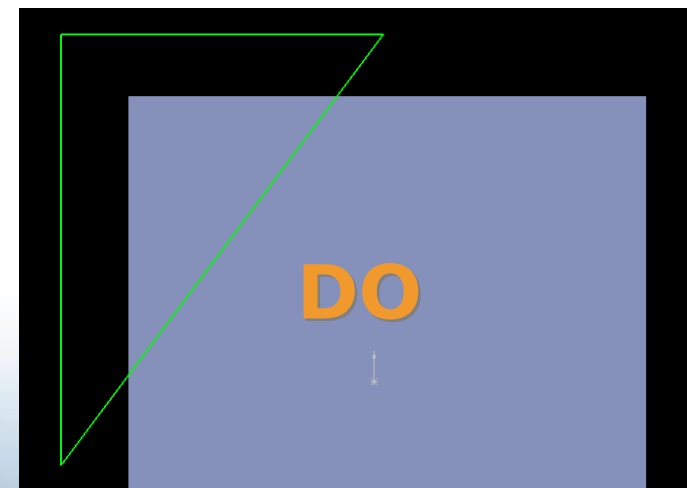

Single Edge as
result of the cut

No more multiple edges but instead "True Nature" of the cut is revealed to be wavy.

Resolving Ambiguity - Workaround

- 1) Don't cut along Solid edges if you can afford to "over-cut"
- 2) Build model using surfaces connected by curve network.

Resolving Ambiguity

This method avoids ambiguity by building to, and connecting directly to existing surface edges.

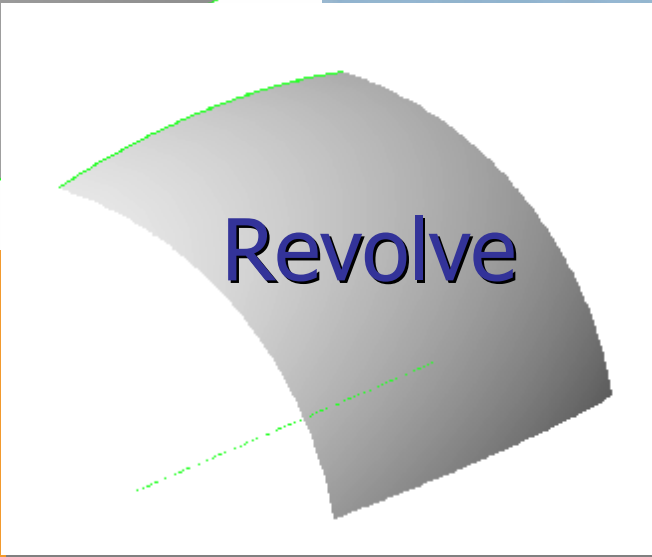

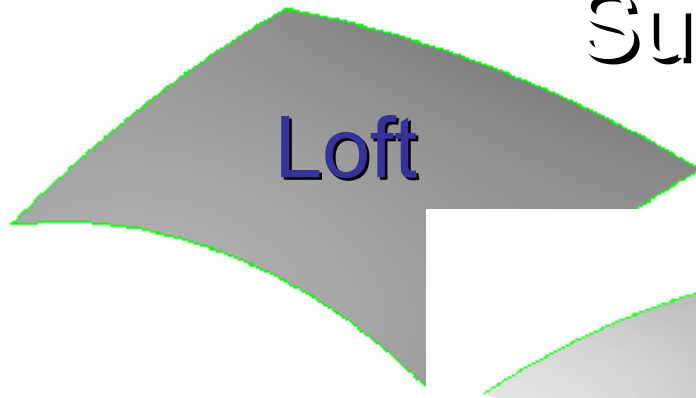

Resolving Ambiguity

Use Replace Face instead of Knit-thicken

Surface Features in SolidWorks

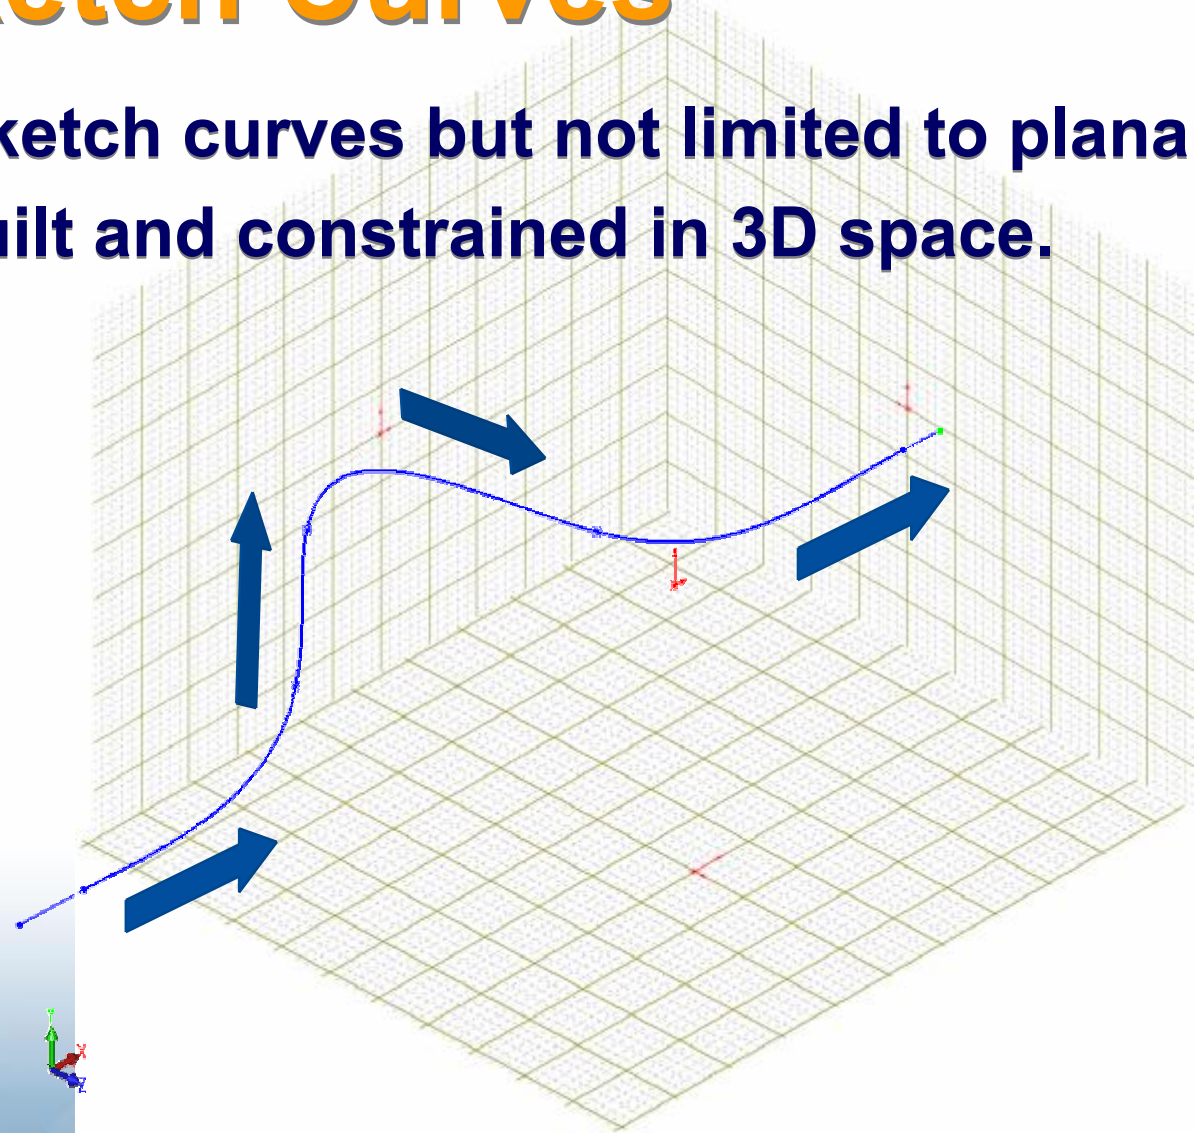

2D Sketch Curves

- Spline sketch entity
- Inspect Curvature Plot Dynamically
- Moving Frames for “tweaking” internal points along the spline

3D Sketch Curves

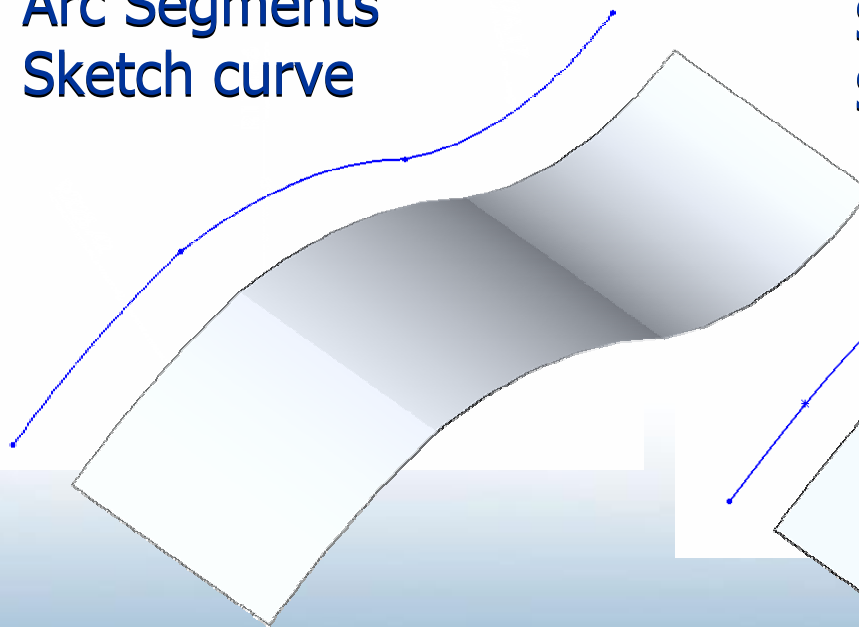

Like 2D sketch curves but not limited to planar.
Can be built and constrained in 3D space.

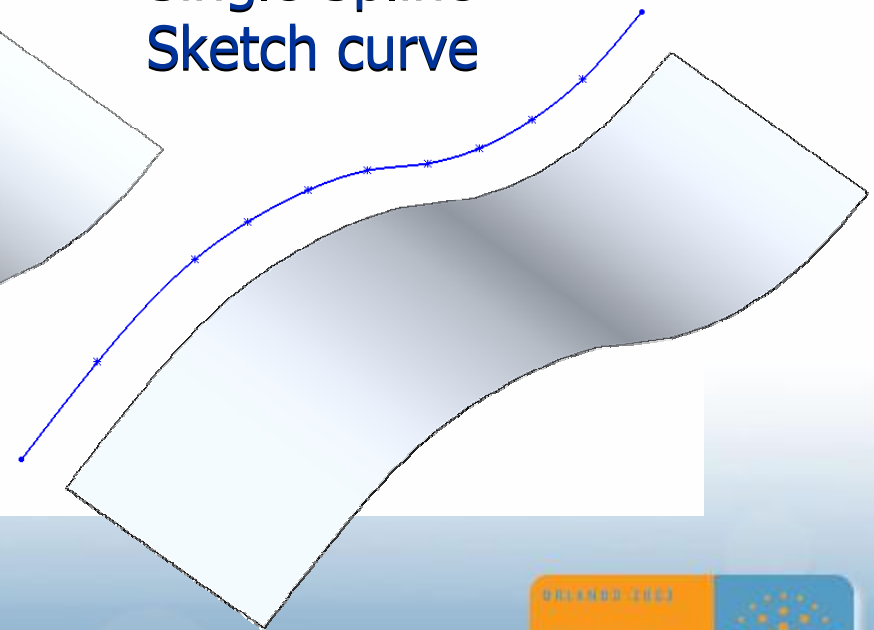

Sketch Curves

“Surfaces are only as good as the underlying curves that they’re built upon.”

Arc Segments
Sketch curve

Single Spline
Sketch curve

Sketch Profiles for Surfacing

- Multiple arc segments
- No Continuity
- More edges in surface
- Profile more susceptible to failure

Sketch Profiles for Surfacing

- A few or one spline elements

- Continuity
- Fewer Interim ISO lines
- Profile less susceptible to failure

2D Sketch Curves

Fit Spline Function automatically overlays single Spline entity onto existing sketch Elements.

NEW FOR 2003

2pt Sketch Spline

Controlling Tangency with Construction

Example

When to use Fill over Loft

3 Sided Loft will not offset because of degenerate vertex between common loft profile vertices

degenerate vertex

Soft with Guide Curve Tangency

Profile 1 (with Tangency)

Guide Curve 4
(with Tangency)

Guide Curve 3 (internal)

Guide Curve 2 (internal)

Profile 2 (with Tangency)

Guide Curve 1
(with Tangency)

Using Fill

Different methods – Loft to Point

Loft between profile and sketch Point.

Key is making sketch point “normal to profile.

Different methods – Loft 3 Profiles

Loft between three sketch profiles; all with common end vertices.

Different methods – Sweep with Guides

Sweep profile thru 2 guides to tangent end point

Different methods – Sweep with Guide Closed loop

Sweep profile thru 2 guides to tangent end point

Different methods – Using Fill with Constraint Curves

Fill Surface built to single boundary with curves constraining cross section

Profile 4

Guide Curve

Controlling Fill Surface Feature

Using Reference surfaces for the boundaries of the fill can dramatically change the shape of the fill surface.

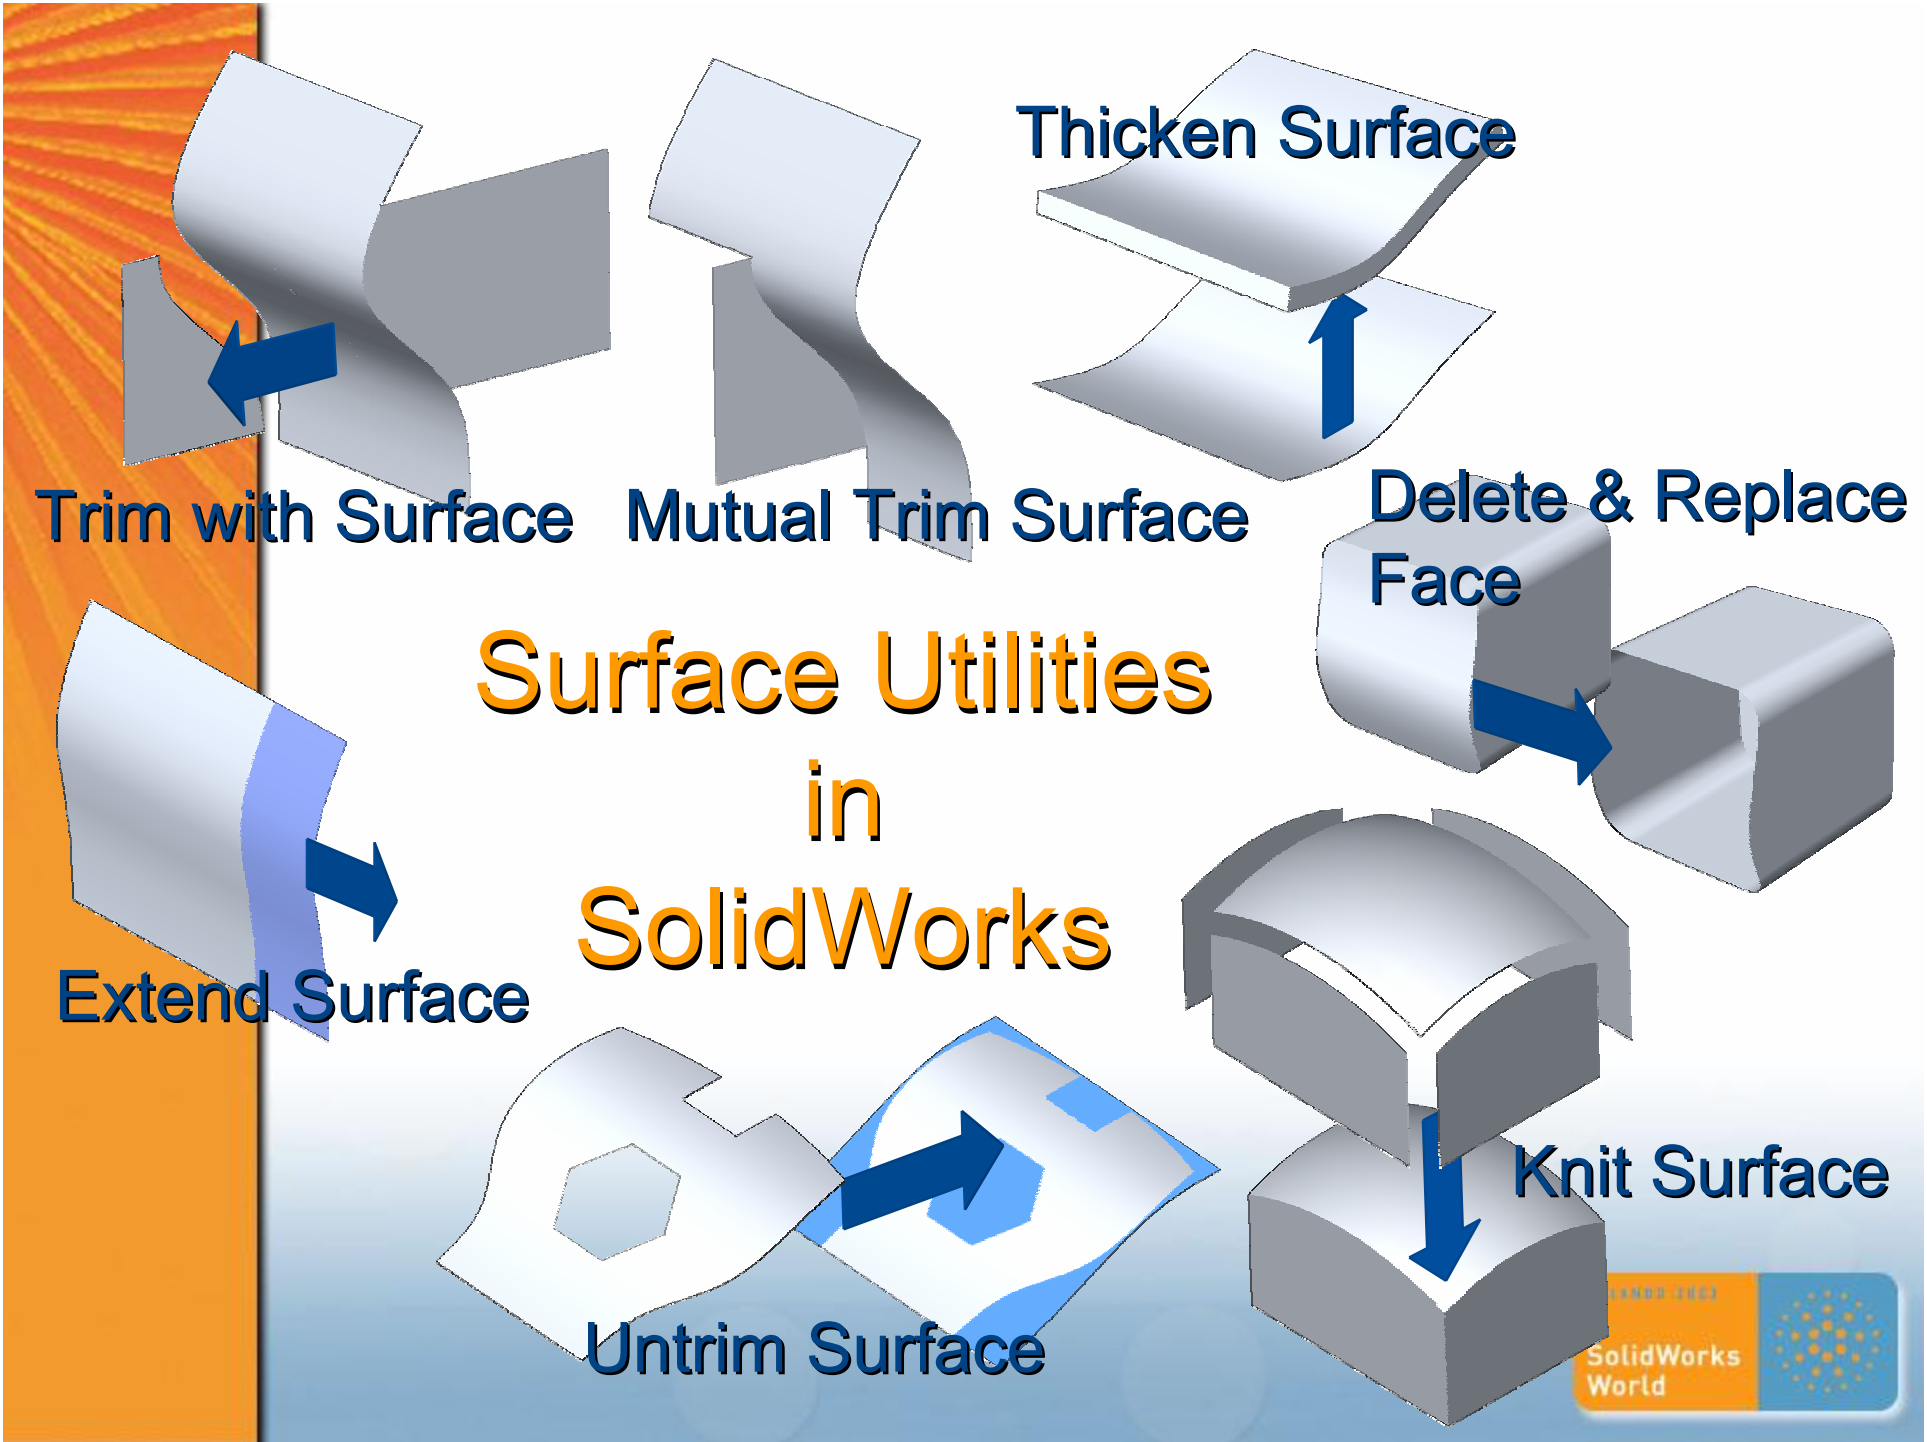

Example

Using sketch contact

Using tangent boundary of Ref. Surface

Trimming and Extending

Trim and Mutual trim

3D
Example

Mutual Trim Knitting/Thickening Exercise

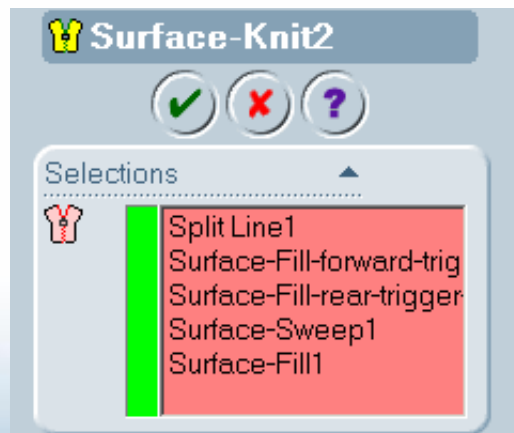

exercise/exercise-knit-make-solid.SLDPRT

- 1) Open file and extrude a surface using sketch "Sketch-for-side-top-surf".
- 2) Use the end condition "mid-plane making sure surfaces extend beyond existing remote surfaces.

Mutual Trim Knitting/Thickening Exercise

- 3) Select the surface body filter tool  (customize it in if you don't have it in your filters toolbar) and INSERT/SURFACE/KNIT
- 4) Select the five surface bodies and complete the knit feature

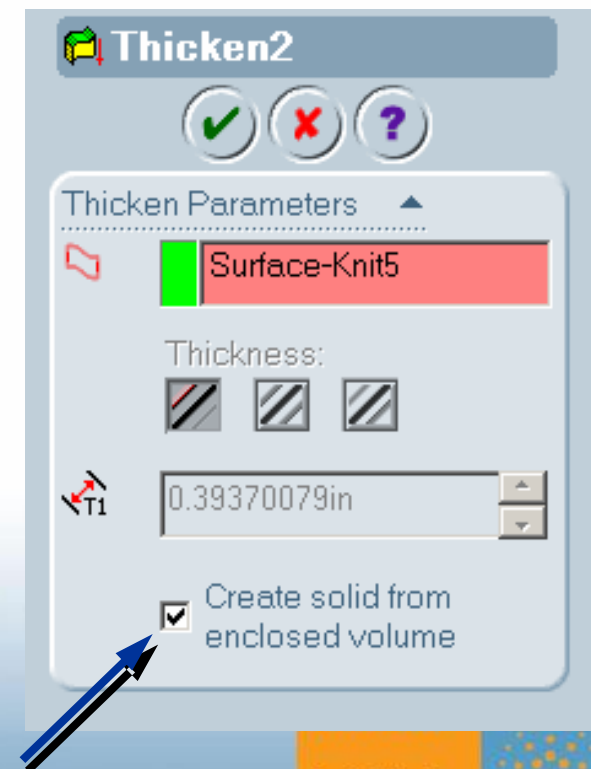

Mutual Trim Knitting/Thickening Exercise

- 5) Deselect the surface bodies filter.
- 6) INSERT/SURFACE/TRIM and select the Surface-knit1 as the trim tool.
- 7) Click on the inner part of the Surface-extrude5 and RMB OK.
- 8) Shift select the last two features in the FM and INSERT/SURFACE/KNIT and complete the feature.

Mutual Trim Knitting/Thickening Exercise

- 9) The final step is to make your surface body solid. Go to INSERT/BOSS/THICKEN.
- 10) Check the "Create Solid from enclosed volume."
- 11) Click OK
- 12) Your surface body is now a solid part.

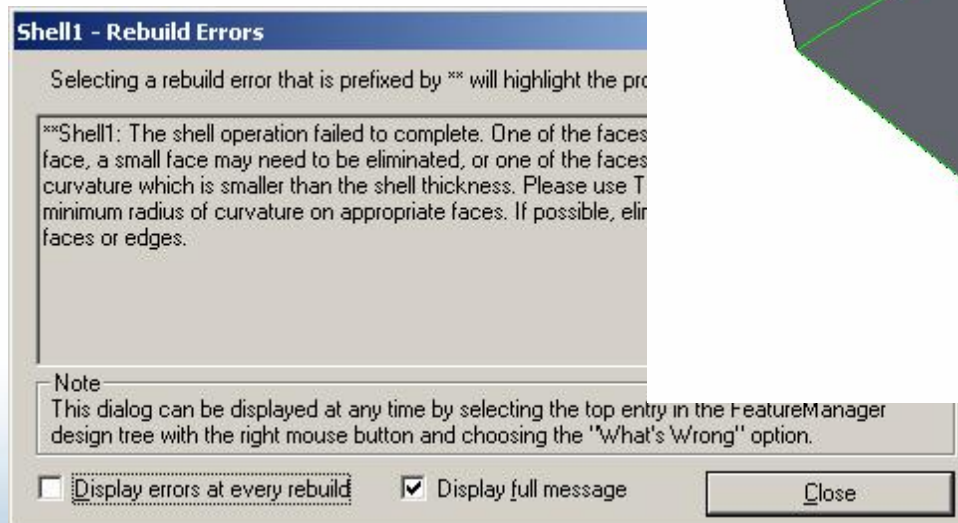

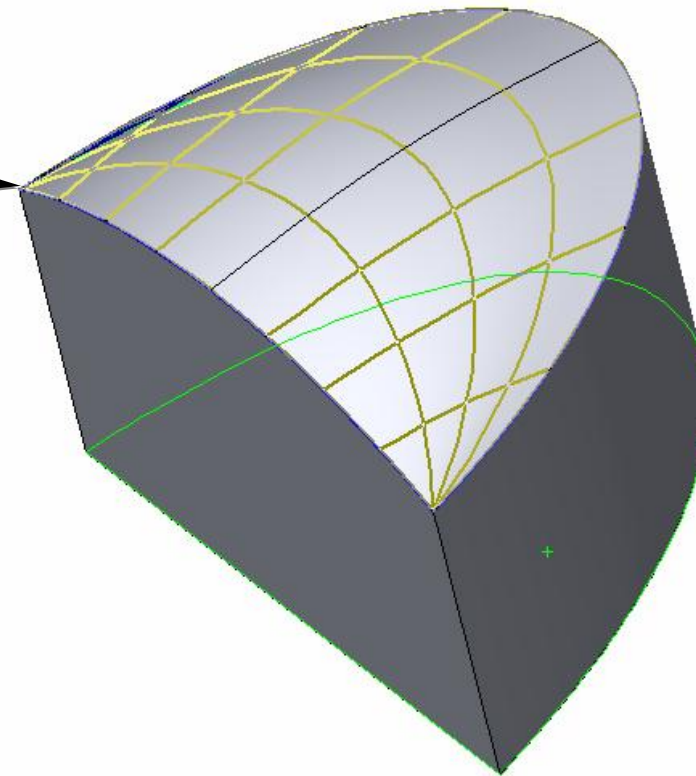

Shelling Problems

“Degenerate Vertex”

3 sided surfaces
will not shell.

Shelling Problems

Use Multi-thickness settings to get shell to “solve”.

.2 inch multi-thickness
Here allows shell to “solve”

.25 inch multi-thickness

.125 inch shell

Shelling Exercise 1

exercise/exercise-shell-error1.SLDPRT

- 1) Try to discover the error that is causing this keypad part's shell to fail.
- 2) Use the diagnostic cut to isolate the shell problem by cutting away "Known" good areas, and pinpoint "bad" areas.

Case Example of Shell workaround

Shelling Tips

- Test Surfaces as you build by using Offset Surface.
- Cut away rest of model that you know is error free
- Work within the shell while it is Suppress.
- Beware of some Variable Fillets that will not shell.
- Use multi-thickness to “help” shell to solve.
- Avoid “3 Sided” or “Triangular” surfaces.
- Avoid Cut-with-Surface along surface to solid edges.

Replace Face/s

Target Face/s to be replace

Replacement Surface/s

Notice that surface does not have to bound target face

Replace Face

Example

Delete Face
